WPI; 2003-731502/69. N-PSDB; ADK65804. Determining the anglogenic index of a tissue or cell sample using expression levels of differentially expressed genes, useful for diagnosing or treating cancer, coronary artery disease, myocardial ischemia and/or arteriosclerosis.

Claim 23; SEQ ID NO 44; 296pp; English.

The invention relates to a method of determining the anglogenic index of a tissue or cell sample comprising assessing, in a sample, the expression levels of one or more differentially-expressed gene from any of 34 DNA sequences, given in the specification, where the levels are indicative of the anglogenic index. The methods and compositions of the present

The invention relates to 2495 novel polynucleotides (I) and their encoded polypeptides, sequences hybridizing to these nucleotides, sequences encoding partial polypeptides and sequences having 70% or 90% identity to the nucleotide and protein sequences. The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or morbid states. They are also useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a protein sequence of the invention.
                                                                                                                                                                                                                                                                     Novel 2495 cDNA, useful for treating osteoporosis, neurological diseases. Alzheimer's diseases, Parkinson's diseases, dementia and various cancers

                                                              rheumatoid arthritis; osteoarthritis; juvenile chronic arthritis; systemic sclerosis; Sjogren's syndrome; vasculitis; sarcoidosis; autoimmune haemolytic anaemia; autoimmune thrombocytopenia; thyroiditis; diabetes mellitus; renal disease; demyelinating disease; central nervous system; peripheral nervous system; demyelinating polyneuropathy; Guillain-Barre syndrome; chronic inflammatory demyelinating polyneuropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic sclerosis, Sjogren's syndrome, vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central or peripheral nervous system, demyelinating polyneuropathy, duillain-Barre syndrome and chronic inflammatory demyelinating polyneuropathy. This sequence represents a human PRO polypeptide of the

This invention relates to a novel isolated polynucleotide comprising a nucleotide sequence selected from one of 1680 sequences, a mature protein coding portion of them, an active domain of them and their complementary sequences. The invention may be useful for the production of compounds with an antiarthritic, antiparkinsonian, neuroprotective, nootropic, immunosuppressive, cytostatic, antipsoriatic, antipfarmatory, antibacterial, antiviral, antifungal or antiparasitic activity. In addition, the disclosed sequences may be useful for gene therapy. The polypeptides or their antibodies are useful for treating many diseases such as arthitis, Parkinson's, Alzheimer's autinimume diseases, cancer, psoriasis, inflammatory bowel disease and infections caused by bacteria, viruses, fundi or parasites. The present sequence is that of a human polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated polynucleotide encoding bone marrow derived polypeptides useful for treating, e.g., Parkinson's, Alzheimer's, cancer, arthritis, Crohn's disease, and inflammatory bowel disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1. .256

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to novel human coding sequences (ABQ99268-ABQ99608) and proteins (ABP64662-ABP65022). The sequences are useful in therapeutic, diagnostic and research methods. The polynucleotides may be used in the field of molecular biology as hybridisation probes, primers for PCR, for chromosome and gene mapping, for the recombinant production of protein, or in generation of anti-sense DNA or RNA. The polynucleotides are useful in diagnostics as expressed sequence tags (EST9) for identifying expressed genes or for physical mapping of the human genome. The proteins may be used as molecular weight markers, or as

cc nutritional sources or supplements. The proteins may be used to maintain and expand cell population in a totipotential or pluripotential state conseful for re-engineering damaged or diseased tissues, transplantation, manufacture of bio-pharmaccuticals or the development of bio-sensors. The colloporating disorders are useful for preventing, treating or ameliorating disorders involving aberrant protein expression or colloporating disorders involving aberrant protein expression or colloporating disorders, amenatopoietic disorders, central/peripheral nervous system diseases, mechanical and traumatic disorders, non-healing wounds, immune deficiencies and disorders, infectious diseases caused by conviral, bacterial or fungal infection, autoimmune disorders, allergic reactions and conditions, coagulation disorders, or cancer. The polymotactide sequences of the invention were assembled from ESTs isolated mainly by sequencing by hybridisation, and in some cases, captures obtained from one or more public databases. Note: The sequence data for this patent did not form part of the printed specification, but we will be published pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  333
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               273
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 QEKKGMEPLQGHATPALPFKETQELLLSPLPQEGPGSLAAGESSSLSASTSVSDSSQKKE 120

           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

a tissue or cell sample comprising assessing, in a sample, the expression levels of one or more differentially-expressed gene from any of 34 DNA sequences, given in the specification, where the levels are indicative of the angiogenic index. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating cancer, coronary artery disease, myocardial ischemia or coronary artery disease, myocardial ischemia or coronary artery disease, myocardial ischemia or coronary force of the involving angiogenesis. This sequence corresponds to one of the differentially expressed proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of determining the angiogenic index of
                                                                                                                           angiogenesis inhibitor; angiogenesis stimulator; angiogenic index; gene expression; cancer; coronary artery disease; myocardial ischemia; coronary arteriosclerosis; forensic medicine.

expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of the polypeptides given in the pain and a pharmaceutical composition comprising the one or more pain and a pharmaceutical composition comprising the one or more polypeptides or thair antibodies. The polynuclectide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (CMI)) in an animal (e.g. spin (e.g. spinal segmental nerve injury (SMI)) in an animal (e.g. spinal paperner of page of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at the wipo int/pub/published_pct_sequences.

The invention discloses a composition comprising two or more insurance of laimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expression of a polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal compound of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound which regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a compound that regulates the activity of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides given in the compound a method for identifying a compound sector in the polypeptides or their antibodies. The polynucleotide or the compound that composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that in the polypeptides or their antibodies. The polynucleotide or the compound that in the polypeptides or their antibodies. The polynucleotide or the compound that composition comprising the one or more injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the sequence data for this patent did not form part of the printed the sequence data for this patent did not form part of the printed contraction which is differentially expressed during pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             136 GKNAKKEDSDEDEDEDEDEDEDEDEDEDEREPPVVKGVKPAKAAPAAPASEDEDEEDDD 195

pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         517 EL-PLTARPRSRKEKNKLAFRACRLKKKAQYEANKVKLWGLNTEYDNLLFVINSIKQE 573

The present sequence is the Kaposi's sarcoma-associated herpesvirus, (KSHV) latency-associated nuclear antigen (LANA). KSHV is also known as Human Herpes Virus 8 (HHV8) and belongs to the rhadino virus, or gamma-2 herpes virus class. The LANA protein is necessary for the efficient persistence of rhadino virus DNA in mammalian cells. Persistent rhadino virus infection is implicated in a variety of diseases e.g. Kaposi's Sarcoma (KS). Primary Effusion Lymphona (PEL) and multicentric castleman's disease. In addition, KS is a common malignancy in HV patients. KSHV persists in host cells in a latent form. One of the few genes expressed from the latent viral DNA is LANA. Associates with coth human chromosomes and with the rhadino virus cis-acting element (RVCAE), thereby providing a tethering function: the KSHV DNA episome is "tied" to the host chromosomes. This allows the viral DNA to persist in the host cell. The present sequence may be used to screen and identify molecules that inhibit LANA interaction with RVCAE, thereby interfering with the latency cycle of this virus. Potential antiviral treatments for the above mentioned diseases may therefore be based on LANA deregulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   124 SSPYQDEEVISKTPTLAQLNSEDSQSVSDSLYYPDSLFSVKQNPLPSSFPGKKITSRAAA 183

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠ
                                                                                                                                                                                                                      The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed construction of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a colypoptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders convolving aberrant protein expression or biological activity. The colypoptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other trails to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     540 LKKKAQYEANKVKLW-GLNTEYDNLLFVINSIKQEIVNRVQNPRDERGPNMGQKLEILIK 598

The important role in the partogenesis of AIDS-related Kaposi's sarcoma. The invention relates to a novel method of detecting the presence of human cantiguents regions of HHV8. The method comprises contacting one or more isolated, immunogenic HHV8 peptides with an antibody-containing biological sample, and detecting the formation of a complex between the biological sample, and detecting the formation of a complex between the presence of human herpesvirus 8. The detection of HHV8 infection can be used to diagnose AIDS-associated Kaposi's sarcoma. The HHV8 entibodies are useful therapeutically when for the passive immunisation of a human against HHV8 infection, thereby reducing HHV8 related disease. The detection assays are highly specific, sensitive accurate Early detection assays are highly specific, sensitive accurate tearly detection and treatment of Kaposi's sarcoma could ciminish the severity of symptoms related to AIDS and the sensitive echniques could reduce erroneous characterisations of skin disorders: rechniques sould reduce erroneous characterisations of skin disorders: revening assays for HHV8 antibodies such as immunoblots and enzyme immunosassays lack the sensitivity and accuracy needed for reliable diagnosis of Kaposi's sarcoma. ```
cc tethering provides a composition comprising nucleic acid, histone H1

Cc for tethering the nucleic acid to the histone H1 protein, where the

Cc tethering protein is LANA. The composition is useful in aiding the

Cc tethering protein is LANA. The composition is useful in aiding the

Cc for compounds which are agonistic or antagonistic for the tethering of

Cc viral proteins to histone H1 and DNA binding sites are useful for

Cc viral proteins to histone H1 and DNA binding sites are useful for

Cc viral proteins to histone H1 and DNA binding sites are useful for

Cc vereloping the method of viral transfer. The composition has applications

Cc opene therapy, including the treatment of multiple sclerosis,

Cc parkingon's disease, huntingon disease and diabetes. The present

C sequence represents the amino acid sequence of the Kaposi's sarcoma

associated herpesvirus (human herpesvirus 8) latency-associated nuclear

antigen (LANA), which acts as a tethering protein. (Updated on 06-NUG-

XX.

2003 to correct OS field.)
